DETAILED ACTION

Allowable Subject Matter

1. Claims 14-29 are allowed.
2. The primary reason for the allowance of claims 14, 22 and 29 is the inclusion of an oxygen sensor and a reference oxygen sensor where the signals produced from both sensors are compared in order to issue an alarm, and where the reference sensor is turned on at regular time intervals in order to produce a second signal and prevent aging of the reference oxygen sensor. It is these features found in the claim, as they are claimed in the combination that has not been found, taught or suggested by the prior art of record, which makes this claim allowable over the prior art.
3. U.S. Patent Application Publication 2002/0040940 (Wagner et al.) discloses a method for controlling fires including an enclosed space and an oxygen sensor. The gas is sampled from the enclosed space through piping with a plurality of holes. The fire detector, including an oxygen sensor, monitors for "fire characteristics" and actuates measures to extinguish a fire when these characteristics are detected. There is no teaching or suggestion to include a second reference sensor.
4. U.S. Patent 6,131,439 (Hamburg et al.) discloses calibrating an oxygen sensor with a reference sensor. Hamburg et al. do not disclose preserving the reference

sensor by activating it at regular time intervals, and issuing an alarm based on the difference in the two signals.

5. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Pertinent Prior Art

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

U.S. Patent 6,601,653 (Grabow et al.) discloses a system for fire suppression by lowering oxygen concentration in a closed space.

U.S. Patent 6,672,397 (Taylor) discloses a fire control system for reducing Oxygen in an enclosed area.

U.S. Patent 6,634,598 (Susko) discloses an inerting system for suppression Oxygen levels in an enclosed area.

U.S. Patent 3,893,514 (Carhart et al.) discloses interting a closed area with nitrogen in order to suppress a fire.

U.S. Patent 5,267,897 (Drees) discloses monitoring Carbon Dioxide in an air conditioning system for which introduces fresh air from outside into the system.

U.S. Patent 5,976,010 (Reese et al.) discloses an air quality maintenance system that controls the level of carbon dioxide by introducing fresh air.
